# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Topic Outline

- Problem Statement, Motivation & Background Context
  - NCCS: Increasing capacities/capabilities & “PI distribution”
  - Success of prior >10 Gbps network testbed efforts
  - More 40 & 100 Gbps network technologies on the way
- Value Proposition & Solution Approach
- Multi-Phased Network Testbed Objectives
- Phase 1 Network-Test Workstations
- Early Stages of Phase 1 & 2 Testbeds
  - WAN File Accessing Experiments/Demonstrations at SC09
  - Build out of Phase 1& 2 Testbeds
- Current Status and Next Steps

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Problem Statement

- GSFC's NASA Center for Computational Sciences (NCCS) is increasing its data production/analysis/storage capacities and capabilities
- Higher bandwidth networks can be deployed
- But something in the combination of our file copying applications, disk I/O subsystems, server/workstation configurations, protocol stack tuning and/or NICs is preventing full use of our higher bandwidth networks

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

Nuttcp (pronounced as new-t-t-c-p or nut-t-c-p)

- Primary author Bill Fink ([william.e.fink@nasa.gov](mailto:william.e.fink@nasa.gov)), with Rob Scott ([rob@hpcmo.hpc.mil](mailto:rob@hpcmo.hpc.mil)).
- Great follow-on to original tcp network throughput performance measurement and troubleshooting tool. Highly recommended. One of the best!
- Over 60 examples of use included in Phil Dykstra's noteworthy tutorial for High Performance Data Transfer (at SC0x's).
- Advanced capabilities/features/options still being added to enable more sophisticated use, while retaining ease-of-use defaults.
- At <http://www.nuttcp.net> & included in perfSONAR's liveCD.

# A Sample Traffic Analysis During MAX's 40-Gbps Interface Testing Between CLPK and MCLN

A joint testing effort among Fujitsu, Juniper, MAX & NASA/GSFC

The statistics were last updated **Tuesday, 14 October 2008 at 9:27**

## 'Daily' Graph (5 Minute Average)

Max In:37.5 Gb/s (94.3%)Average In:31.5 Gb/s (7.8%)Current In:18.7 Gb/s (47.0%)  
Max Out:37.6 Gb/s (94.4%)Average Out:31.5 Gb/s (7.8%)Current Out:18.7 Gb/s (47.0%)

Snapshot taken during MAX NASA JUNIPER FUJITSU 40G INTEROP Test: One 10G stream from each of two pair of NASA line-rate nuttcp-servers is hard looped between some Juniper T1600 10G interfaces to fill the Juniper OC768c interfaces and Fujitsu 40G optical transponders set up between MAX POP's at College Park, MD and McLean, VA.

Color Legend:  
Grey: MAX existing  
Yellow: Fujitsu loaner  
Green: Juniper loaner  
Blue: NASA loaner

The approach used behind NASA and MAX's "snake testing" is that because 40G applications are rare and OC768 testers expensive, 10G streams from line-rate bit blasters are muxed together and hard looped between the 10G interfaces to fill the OC768 lambda. MPLS and possibly virtual routers will be used on the Junipers to separate the streams. DWDM pluggable XFP optics will be used on the NASA bit blasters and the College Park Juniper 10G interfaces to enable the blasters to remain at NASA/GSFC for convenience. Juniper loaned the T1600 routers so that there would be no interaction with the MAX production T640 routers with the upgrade to support the 4x 10G pic. Any issues with the Fujitsu 40G test lambdas should not impact the MAX production 10G lambdas over the existing diverse paths.

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### 40 Gbps Network Testing Between CLPK and MCLN

- Very successful; very informative
- Summary in “Industry Leaders Collaborate on 40 Gbps Live Network Trial” press release at [http://www.businesswire.com/portal/site/google/?ndmViewId=news\\_view&newsId=20081110005564&newsLang=en](http://www.businesswire.com/portal/site/google/?ndmViewId=news_view&newsId=20081110005564&newsLang=en)

### **BUT**

- No file copying application testing
- “Toothpaste-looping” flows, while innovative and sufficient for intervening network testing, are inappropriate for file copy testing
- Need higher performing network-test workstations for investigations focused on application throughput limitations

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Even 100 Gbps Networks Are Beginning To Emerge

- The Internet2 and the National LambdaRail (NLR) are upgrading their infrastructure to support 40-to-100 Gbps wavelengths
- IEEE P802.3ba Task Force has planned its Sponsor Balloting starting in November 2009 and full completion of both the 40 and 100 Gbps Ethernet (GE) standards by mid-2010 (<http://www.ieee802.org/3/ba/index.html>)
- A partnership among ESNet, Internet2, Juniper Networks, Infinera, and Level3 Communications has announced the formation of a 100 GE testbed (<https://mail.internet2.edu/wws/arc/i2-news/2008-11/msg00000.html>)
- <http://www.hpcwire.com/offthewire/ESnet-Receives-62M-to-Develop-Worlds-Fastest-Computer-Network-52989552.html?viewAll=y>

GODDARD SPACE FLIGHT CENTER

J. P. Gary

15

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Value Proposition (Time Is Money)

- Time-decreased data flows increase time for other productive work with the data
- Achieving time-efficient data flows over wide areas is notoriously problematic (“un-tuned” read/write/protocols, deficient disk I/O performance, ...)
  - Even over 10-Gbps networks, throughput is often only ~10-Mbps, so copying a single 10-GB file typically takes ~17 minutes
- Need to determine data transfer utilities and protocols that enable higher throughput, especially given the emergence of 40- to 100-Gbps networks

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

16

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Part of the Solution

- Prepare applicable testbeds to identify the bottlenecks and investigate solutions/alternatives
  - Plan multi-phased LAN, MAN & WAN testbeds with 20, 40 & 100 Gbps throughput performance objectives
  - Assemble low-cost high-performance network-test workstations to assess/troubleshoot:
    - New network technologies
    - File copying application tuning
  - Arrange joint collaboration on WAN file-accessing applications with NCCS and NASA Advanced Supercomputing (NAS) Division data management experts to ensure that the network testbed efforts will have at least HEC Program applicability
- Transition findings into production environments

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

17

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Multi-Phased Network Testbed Objectives

- A series of partly overlapping approximately-two-year Phases
- Each producing a demonstrable network capability with end-to-end throughput performance goals targeted respectively at 20, 40 & 100 Gbps
- Each with joint collaboration on WAN file-accessing applications with NCCS and NAS data management experts to ensure that the network testbed efforts will have at least HEC Program applicability

[1] P. Gary, "Plan/Proposal For Initiation of 20, 40 & 100 Gbps Network Technology Testbeds", 29Jan09 draft proposal for potential submission to the NASA Strategic Investment Business Case (SIBC) Initiative for Networking R&D that is expected to emerge soon within NASA.

[2] D. Duffy et al, "NASA High End Computing Selected Wide Area Network Testing: Representative Test Plan", 18Mar09 draft.

Both [1] and [2] were emailed to HEC's network engineers at NAS and NCCS.

J. P. Gary

18

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Example Throughput Performance Benchmarking

- Several representative test types are described in [2], including ones involving:
  - nuttcp at wire transfer speeds for the much needed performance baseline against which all subsequent performance measurements will be compared
  - scp, bbftp, nfs, iRODS, GridFTP and other file transfer mechanisms that NASA HEC users jobs use at both NAS and the NCCS to move data back and forth over the wide area
  - iSER and iSCSI over RDMA to mount the disks either locally or remotely
  - GPFS and/or Lustre shared file system
- Actual throughput performance results will be widely distributed once they are available

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Phase 1 Network-Test Workstation Functional Objectives with Performance Targets (1 of 2)

- “B” (Baseline) systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 40-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps “total”)
  - Secondarily for WAN file copying application throughput evaluations in disk-to-disk testing at up to 10-Gbps unidirectional
- “C” systems:
  - Primarily for WAN file copying application throughput evaluations in disk-to-disk testing at up to 20-Gbps unidirectional
- “A” systems:
  - Primarily for WAN delay emulation at up to 40-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps “total”)
  - Also as firewall at up to 20-Gbps unidirectional, 20-Gbps bidirectional (40-Gbps “total”)

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

21

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Phase 1 Network-Test Workstation Functional Objectives with Performance Targets (2 of 2)

- “A+” systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 70-Gbps unidirectional, 40-Gbps bidirectional (80-Gbps “total”)
    - Actual performance: On 12Jun09 using eight streams between two A+ systems connected via eight 10GE’s, measured an aggregate performance of 69.2907 Gbps unidirectional, and bidirectional 38.6955 Gbps transmit & 38.5842 Gbps receive (77.2797 Gbps total aggregate)
- “A-” systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 20-Gbps unidirectional, 20-Gbps bidirectional (40-Gbps “total”)

22

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Phase 1.1 Network-Test Workstation Functional Objectives with Performance Targets

- “A++” systems:
  - Primarily for network throughput evaluations via nuttcp memory-to-memory testing at up to 100-Gbps unidirectional, 50-Gbps bidirectional (100-Gbps “total”)
- Actual performance “in-progress”
  - On 6Aug09 measured an aggregate performance of 100.4637 Gbps in transmits; but currently only up to 56.4703 Gbps in receives
    - Test configuration has each of the two quad-core Xeon processors of one A++ system connected via six 10GE’s to one of two quad-core i7-based A+ systems
    - Twelve streams are generated – one for each of the twelve 10GE connections handled by the one A++ system

# 10-Gbps Disk-to-Disk File Copies Achieved Via Workstations Costing Less Than \$7,000

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network Team specified and assembled workstations that individually costs less than \$7,000 and are capable of over 10 gigabits per second (Gbps) disk-to-disk file copying.
- Each workstation consists of a 3.2-GHz single-processor (quad core) Intel Core i7 (Nehalem) with two HighPoint RocketRaid 4320 RAID disk controllers and a Myricom 10 Gigabit Ethernet network interface card in the PCIe Gen2 slots of a Asus P6T6 WS Revolution motherboard. Each RAID controller hosts eight Western Digital WD5001AALS 500-gigabyte disks.
- Over 10-Gbps disk-to-disk file-copying throughput between two of the workstations was measured using the nuttscp ([www.nuttcp.net](http://www.nuttcp.net)) file copying tool.
- Demonstrations of these workstations supporting network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental are planned in the NASA research exhibit at the SC09 conference, Portland, OR, November 16–19 .

**Figure:** Two Core i7 workstations interconnected via 10 Gigabit Ethernet in test configuration prior to shipping to SC09.

39151.9019-Mbps 91% TX 92% RX 1 = 0+0+1+0 retrans 0.11ms RTT
  - 10 second test:  
39318.0384-Mbps 80% TX 90% RX 1 = 0+0+1+0 retrans 0.10ms RTT
  - 10 second test:  
39406.0384-Mbps 79% TX 92% RX 1 = 0+0+1+0 retrans 0.10ms RTT

\*Obtained while testing nuttcp-7.1.1’s new features for:

- Improved multilink aggregation specification options (e.g., stride & dotted quad)
- Providing summary TCP retrans info for multi-stream TCP (with per-stream info for Linux)
- Allowing local name resolution to occur for third party nuttcp tests if the remote third party host can’t resolve the specified test hostname

# 100 Gigabits per Second Transmissions Achieved Via A Single Workstation

- As part of plans to assess the throughput performance of wide-area file transfer applications, GSFC's High End Computer Network (HECN) Team specified and assembled a workstation that costs less than \$11,000 and is capable of over 100 gigabits per second (Gbps) data transmission – 10 times the transmission speed of most high end computers.
- The workstation consists of a 3.2-GHz dual-processor (quad core) Intel Xeon W5580 (Nehalem) with six Myricom dual-port 10-Gigabit Ethernet network interface cards in the PCIe Gen2 slots of a Supermicro X8DAH+-F motherboard.
- Over 100-Gbps aggregate-throughput transmissions from the Xeon-workstation to two Intel Core i7 workstations (also specified and assembled by the HECN Team) were measured using the nuttcp ([www.nuttcp.net](http://www.nuttcp.net)) network-performance testing tool.
- Demonstrations of these workstations supporting network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental are planned in the NASA research exhibit at the SC09 conference, Portland, OR, Nov. 16–19 .

**Figure:** Xeon and two Core i7 workstations (bottom) interconnected with 10 Gigabit Ethernet switch and management units (top) in a rack for shipping to SC09.

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Topic Outline

- Problem Statement, Motivation & Background Context
  - NCCS: Increasing capacities/capabilities & “PI distribution”
  - Success of prior >10 Gbps network testbed efforts
  - More 40 & 100 Gbps network technologies on the way
- Value Proposition & Solution Approach
- Multi-Phased Network Testbed Objectives
- Phase 1 Network-Test Workstations
- • Early Stages of Phase 1 & 2 Testbeds
  - WAN File Accessing Experiments/Demonstrations at SC09
  - Build out of Phase 1& 2 Testbeds
- Current Status and Next Steps

## Introduction To NASA HEC WAN File Accessing Experiments/Demonstrations At SC09

### Objectives of NASA HEC WAN File Accessing Experiments

- Determine optimal ‘tuning parameter’ settings to obtain maximum user throughput performance with several traditional and new (or emerging) disk-to-disk file-copying utilities when operating over multi-10Gbps WANs using new state-of-the-art high performance workstations and servers
- Inter-compare throughput findings from traditional versus new file-copying utilities
- As a baseline, determine maximum memory-to-memory throughput performance among the workstations and servers using nuttcp (<http://www.nuttcp.org/>)
- Are an integral part of GSFC/HEC’s 20, 40 & 100 Gbps Network Testbed Plan

# Optimizing Wide-Area File Transfer for 10-Gbps and Beyond

- Demonstrations of network-performance testing, wide-area file systems, and file transfer applications ranging from traditional to experimental were provided in the NASA research exhibit at the SC09 conference, Portland, OR, Nov. 16–19.
- Jointly planned by GSFC's High End Computer Network Team and NCCS' Advanced Development Team, an indication of the wide-area file transfer applications demonstrated and evaluated is shown in the Data Transfer Test Matrix (top figure) and the WAN infrastructure and servers tested are shown in the configuration diagram (bottom figure).
- Demonstration highlights included over 100 gigabits per second (Gbps) uni-directional memory-to-memory data transmissions between in-booth servers, 40-Gbps bi-directional memory-to-memory data transmissions between servers in-booth and at ARC, 10-Gbps disk-to-disk data transfers between in-booth servers, between servers in-booth and at ARC, and between servers in-booth and at GSFC.

J. P. Gary

J.P. Gary/A. Muppalla  
6/17/09

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Key Notes Regarding the Previous Diagram (1 of 2)

- The diagram's title is "Current Candidate 40-Gbps MAN & WAN Pathways For Use During Early Stages of Phase 1 20-Gbps and Phase 2 40-Gbps Testbeds"; and the referenced Testbeds were identified and/or described in [1] and [2]
- Where different but parallel pathways are shown (such as Internet2 vs NLR, and DRAGON's ADVA vs MAX's Fujitsu MAN pathways to MCLN) only one WAN and one MAN pathway is needed; but we'll have enough ports on our 10-GE switches to accommodate both WAN pathways and both MAN pathways without re-cabling if the opportunities should arise
- In the Early Stages, 4x10-GE link aggregation (LAG) is key (vs later stages if/when 40-GE Media Access Controllers (MACs) become available and affordable)

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

50

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Key Notes Regarding the Previous Diagram (2 of 2)

- Use of Layer 1+2 DCN-enabled VLANs versus Layer 1+2+3 full IP routed networks in both the Regional/MAN and WAN testbeds is critical
  - Sufficient to enable more effort to be focused on the primary subjects of this plan/proposal which are the processor interfaces and LAN infrastructure needed on the ends of the intervening links
  - Core IP routing issues (while otherwise interesting with many R&D challenges remaining) are not the primary subject of this plan/proposal
  - Costs of 40 and 100 Gbps Layer 1+2+3 router interfaces are likely to be two or more orders of magnitude greater than 40 and 100 Gbps Layer 1+2 Ethernet switch interfaces which are sufficient to enable the needed VLANs

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Current Status (1 of 3)

- Our testbed plans are in their early stages of development and are a “work-in-progress”
- We have gotten excellent support from our collaborators, especially the MAX, NAS/NREN & NLR; and we’re beginning to pick up quite a bit of steam
  - Completed significant SC09 experiments/demonstrations
  - Two B-systems remain deployed at ARC post-SC09
  - Several A-, B-, & C-systems deployed at GSFC
  - Two B-systems are in preparation for deployment to MCLN
  - Four new 10-Gbps DRAGON-enabled DWDM links between GSFC and McLean (MCLN) are turned up
  - Two B-systems are deployed to StarLight
  - Four new 10-Gbps NLR-enabled DWDM links between MCLN and StarLight (@Chicago) are ready for turn up and use

## GSFC/High End Computer Network (HECN) and Partners 10GE and 10G Lambda Connections Through McLean

*Note: The non-GSFC/HECN systems shown typically have other connections that are not shown in this diagram, as the focus is primarily GSFC/HECN connections*

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Current Status (2 of 3)

- “More steam”
  - Four new 10-Gbps HECN-enabled DWDM links between GSFC and College Park (CLPK) are ready to be deployed
  - Two B-systems are in preparation for deployment to CLPK
  - Expect one 40-Gbps NLR-enabled muxponder link between MCLN and StarLight starting in mid-2010
  - Expect one 40-Gbps MAX-enabled muxponder link between CLPK & MCLN starting in late-2010, with potential as a 100-Gbps link not long after
  - Obtained approval to be informal partners in DoE’s high performance file accessing testbed and have access to their upcoming ANI 100-Gbps Prototype Network between ANL (connected via StarLight) and NERSC (connected at Sunnyvale)

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

54

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Current Status (3 of 3)

- Intra-NASA we'll seek broader sponsorship via an "information" Emerging Network Technology Testbed initiative
- In the meantime we offer an open invitation to be involved
  - To extend the base of owning and/or testing network-test workstations like we have
  - To develop and/or test variants to network-test workstations like we have
  - To participate in and/or learn from the various WAN file accessing applications we're investigating
  - To enhance your status vis-à-vis NSF Academic Research Initiative proposals if you are university based

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Significant >10G Accomplishments of HECN Team & Partners (1 of 5)

CY2008		CY2009				CY2010			
4Q	1Q	2Q	3Q	4Q	1Q	2Q	3Q	4Q	
1	2	3 4	5	6 7 8 9	10	11 12 13			

- 1: 10/14/08 In collaboration with MAX across MAX-provisioned link between College Park and McLean, bi-directionally tested maximum throughput of Fujitsu 40G optical transponders & Juniper OC-768c interfaces on T1600 routers
- 2: 01/29/09 Created initial drafts of HECN 20, 40 & 100G Network Testbed plans
- 3: 06/12/09 Bench-tested HECN's first >10G net-test-workstations (i7-based) measuring nuttcp-enabled memory-to-memory throughput flows unidirectionally at >69.2G and bi-directionally at >77.2G aggregate
- 4: 06/24/09 Presented "Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds" at MAX Spring 2009 All Hands Meeting

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Significant >10G Accomplishments of HECN Team & Partners (2 of 5)

- 5: 08/06/09 Bench-tested a new HECN net-test-workstation (Xeon-based) measuring nuttcp-enabled memory-to-memory throughput flows unidirectionally (transmit) at >100.4G
- 6: 10/30/09 Two HECN net-test-workstations (i7-based) each with 4x10G NIC interfaces, deployed at ARC, used by NREN in prep for SC09 to fully check out new 4x10G links on single fiber pair between ARC and Sunnyvale using ADVA FSP3000 dwdm mux/demuxes
- 7: 11/02/09 Using two HECN net-test-workstations (i7-based) each with two RAID5 disk controllers nested as RAID50, measured nuttscp-enabled disk-to-disk data throughput unidirectionally at >9.8G in a 0.1ms RTT testbed; on 11/10/09 measured >9.5G in a 80.1ms RTT testbed

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Significant >10G Accomplishments of HECN Team & Partners (3 of 5)

CY2008		CY2009				CY2010			
4Q	1Q	2Q	3Q	4Q	1Q	2Q	3Q	4Q	
1	2	3 4	5	6 7 8 9	10	11 12 13			

8: 11/02/09 Using two HECN net-test-workstations (i7-based) in nuttcp-enabled memory-to-memory throughput flows, with kernel bonding/standard link-aggregation among each workstation's 4x10G NIC interfaces measured unidirectionally >31.6G and with nuttcp-enabled "application bonding" measured unidirectionally >39.5G

9: 11/16/09 In the NASA research exhibit at the SC09 conference, Portland, OR, demoed: >100G uni-directional memory-to-memory data throughput between in-booth HECN servers; 40G bi-directional memory-to-memory data throughput between HECN servers in-booth and at ARC across 4x10G NLR/C-Wave links; and 10G disk-to-disk data throughput between in-booth HECN servers, between HECN servers in-booth and at ARC, and between HECN servers in-booth and at GSFC

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Significant >10G Accomplishments of HECN Team & Partners (4 of 5)

- 10: 03/24/10 In collaboration with MAX, added 4x10G links across MAX's DRAGON regional optical network between GSFC and the NASA rack in the Level3 PoP at McLean, and then through MAX's ADVA dwdm mux/demuxes to NLR's Cisco 15454 optical transponder at that PoP
- 11: 04/07/10 In collaboration with iCAIR, deployed two HECN net-test-workstations (i7-based) at StarLight for 4x10G connections with NLR and 8x10G connections with other R&D networks
- 12: 04/14/10 In collaboration with NREN, used two HECN net-test-workstations (i7-based) at ARC to measure unidirectional and bidirectional throughput of a Fortinet FortiGate-3810A security gateway with four 10GE ports

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Significant >10G Accomplishments of HECN Team & Partners (5 of 5)

CY2008		CY2009				CY2010			
4Q	1Q	2Q	3Q	4Q	1Q	2Q	3Q	4Q	
1	2	3 4	5	6 7 8 9	10	11 12 13			

13: ~04/30/10 NLR turned up new 4x10G links between McLean and StarLight for HECN maximum throughput testing; HECN then demoed 40G bi-directional memory-to-memory and 10G unidirectional disk-to-disk data throughput between HECN servers at GSFC and StarLight

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Next Steps (Near Term) with Key Challenges

- Complete Phase 1 network-test workstation assembly, bench tests, and deployments - LAN, MAN, WAN
  - Including more comprehensive file-copy application testing and tuning to achieve throughput performance objectives
- Investigation of candidate Phase 2 network-test workstations, refinement of Phase 2 throughput performance objectives, and refinement of Phase 2 LAN, MAN, WAN pathway targets
  - Opportunities/challenges to obtain 40-Gbps disk subsystems at low cost
  - Opportunities/challenges to obtain early 40 & 100 GE-MAC-interfaces in the Phase 2 testbeds
- Leveraging NASA's "in-formation" Emerging Network Technology Testbed initiative

# Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

## Summary of HEC Test WAN Requirements

- Key SLA Requirements of HEC's WAN Test Network
  - Availability (percent): 80.0
  - Restoral Time: <48 hours
  - Coverage Period: 24x7
  - RTT between sites in CONUS: <100ms
  - Packet Loss: <1E-7
  - Jumbo Frames: Transport of 9000-byte IP MTU jumbo frames without fragmentation
  - Bandwidth between NAS@ARC and NCCS@GSFC:
    - 1Jul11 through 30Jun13: 40Gbps (i.e., 1x40G, not 4x10G or other LAG approaches)
    - 1Jul13 through 30Jun15: 100Gbps (i.e., 1x100G, not 10x10G or other LAG approaches)
- The above SLA requirements apply only to the “TTT...TTT” links
- The SLA requirements of “OOO...OOO” links are similar to “TTT...TTT” links except that “OOO...OOO” links have their Availability (percent) parameters at 99.50 and their Restoral Time parameters at 4 hours; and therefore they likely need to be provisioned from a different supplier than “TTT...TTT” links

# NCCS Data Centric HPC Environment

Source: Phil Webster (GSFC/NCCS)

## Data Sharing

- Capability to share data & results
- Supports community-based development
- Facilitates data distribution and publishing

## Code Development\*

- Code repository for collaboration
- Environment for code development and test
- Code porting and optimization support
- Web based tools

## User Services\*

- Help Desk
- Account/Allocation support
- Computational science support
- User teleconferences
- Training & tutorials

## Data Transfer

- Internal high speed interconnects for HPC components
- High-bandwidth to NCCS for GSFC users
- Multi-gigabit network supports on-demand data transfers

## DATA Storage & Management

Global file system enables data access for full range of modeling and analysis activities

## HPC Compute

- Large scale HPC computing
- Comprehensive toolsets for job scheduling and monitoring

## Data Archival and Stewardship

- Large capacity storage
- Tools to manage and protect data
- Data migration support

## Analysis & Visualization\*

- Interactive analysis environment
- Software tools for image display
- Easy access to data archive
- Specialized visualization support

# Plan/Proposal For Initiation of 20, 40 & 100 Gbps Network Technology Testbeds

## Planned/Proposed Efforts Overview (1 of 4)

- A multi-phased plan which involves a series of partly overlapping approximately-two-year Phases
- Each Phase focused on producing a demonstrable end-to-end network capability with particular throughput performance goals
  - Matched to then-readily-available technologies
    - Particularly to include dense wave division multiplex (DWDM) optics carrying dynamic circuit network (DCN)-enabled VLANs, switch/routers, NICs, and processors with suitable disk connections
  - Expected respectively to target 20, 40 and 100 Gbps end-to-end throughput performance goals
- Each Phase to include:
  - LAN and Regional/metropolitan area network (MAN) testbed deployments/demonstrations partly funded from existing HEC-related budgets (assuming existing FY09 levels through FY11)
  - A WAN testbed deployment/demonstration only if additional funding is made available via this proposal
  - Joint collaboration on the iRODS[10] and/or other WAN file-accessing applications with NCCS and NASA Advanced Supercomputing (NAS) Division data management experts to ensure that the network testbed efforts will have at least HEC Program applicability

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

77

## Plan/Proposal For Initiation of 20, 40 & 100 Gbps Network Technology Testbeds

### Planned/Proposed Efforts Overview (2 of 4)

- End-to-end throughput performance goals in each Phase means
  - File-accessing applications, which typically are disk-to-disk, of representative end users will be involved in determining the criterion of success of those Phases
  - Memory-to-memory data flow applications also
    - Oriented to detailing the throughput performance of just the Layer 1 Physical through Layer 4 Transport layers of the end-based testing-computers and the intervening network components
- WAN emulation testing will be included in the LAN testbed deployments/demonstrations
- Regional/MAN and WAN testbed deployments/demonstrations are planned to more appropriately address the full scope of problems that occur when larger round-trip times (RTTs) affect file-accessing applications

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

78

## Plan/Proposal For Initiation of 20, 40 & 100 Gbps Network Technology Testbeds

### Planned/Proposed Efforts Overview (3 of 4)

- Use of Layer 1+2 DCN-enabled VLANs versus Layer 1+2+3 full IP routed networks in both the Regional/MAN and WAN testbeds is critical
  - Sufficient to enable more effort to be focused on the primary subjects of this plan/proposal which are the processor interfaces and LAN infrastructure needed on the ends of the intervening links
  - Core IP routing issues (while otherwise interesting with many R&D challenges remaining) are not the primary subject of this plan/proposal
  - Costs of 40 and 100 Gbps Layer 1+2+3 router interfaces are likely to be two or more orders of magnitude greater than 40 and 100 Gbps Layer 1+2 Ethernet switch interfaces which are sufficient to enable the needed VLANs

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

79

## Plan/Proposal For Initiation of 20, 40 & 100 Gbps Network Technology Testbeds

### Planned/Proposed Efforts Overview (4 of 4)

- 40 and 100-GE Regional/MAN and WAN testbeds will include complementing and interconnecting with that of ESnet+Internet2+ Juniper+Infinera+ Level3 and/or other modern-day-NGI networks to the greatest extent possible
- The WAN testbed, which is planned/proposed primarily only between the ARC-based NAS and the GSFC-based NCCS, is critical to enable joint technical interoperability and end-user applicability testing of iRODS and/or other WAN file-accessing applications

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Phase 1 Network-Test Workstations: Nominal “B” System

- Chassis: Supermicro 836TQ-R800B (3u 16bay 7slot 800W RPS)
- Motherboard: Asus P6T6 WS Revolution (5 PCIe V2 x8)
- Processors: one Intel i7 965 (3.2GHz quad-core Nehalem)
- Memory: Kingston KHX16000D3ULT1K3 (6GB 2000MHz DDR3 CL8)
- System disks: one Western Digital WD2500BEKT (2.5” 250GB)
- NICs: two Myricom 10G-PCIE2-8B2-2S+E (Dual 10GE SFP+)
- Raid controllers: two HighPoint RocketRaid 4320 (internal, 8 disks each)
- User disks: 16 Western Digital WD5001AALS (500GB)
- IB HCA: one Qlogic QLE7280 (DDR, 8x)
- For more detail, contact [Paul.Lang@nasa.gov](mailto:Paul.Lang@nasa.gov)

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Phase 1 Network-Test Workstations: Nominal “C” System

- Nominal “B” (Baseline) System
- Minus:
  - NICs: One Myricom 10G-PCIE2-8B2-2S+E (Dual 10GE SFP+)
  - IB HCA: one Voltaire (DDR, 8x)
- Plus:
  - Raid controllers: two HighPoint RocketRaid 4322 (external, 8 disks each)
- Plus via SAS-connection:
  - Chassis: one Supermicro 836TQ-R800B (3u 16bay 7slot 800W RPS) with SAS converter/adaptor and cables
  - User disks: 16 Western Digital WD5001AALS (500GB)
- For more detail, contact [Paul.Lang@nasa.gov](mailto:Paul.Lang@nasa.gov)

## Introduction To GSFC High End Computing 20, 40 & 100 Gbps Network Testbeds

### Phase 1 Network-Test Workstations: Nominal “A” System

- Nominal “B” (Baseline) System
- Minus:
  - Raid controllers: two HighPoint RocketRaid 4320 (internal, 8 disks each)
  - User disks: 16 Western Digital WD5001AALS (500GB)

# “Emerging Network Technology” Testbed

High-end network technology collaboration  
within NASA

In Formation  
by: OCIO  
NISN  
and HEC

## Emerging Network Technology Testbed

*Staffed by ARC, GSFC, MSFC*

**Managed**

*Including annual negotiation of experiments*

**Relationships**

### Stakeholders

**NASA Integrated Services  
Network (NISN)**  
*Led by MSFC*

**High-End Computing  
Capability (HECC)**  
*HEC Facility at ARC*

**NASA Center for Computational  
Sciences (NCCS)**  
*HEC Facility at GSFC*

...

### Scope:

- ✓ Prototype advanced commercial networking capabilities in collaboration with stakeholders
- ✓ Maintain NASA's dedicated advanced peering capability
- ✓ Support integration testing infrastructure
- ✓ Assure Civil Servant high-end networking technical expertise

04/16/10

GODDARD SPACE FLIGHT CENTER

88

# ENTT Vision

Source: Kevin Jones (ARC)

- Formally establishes an emerging network technology focused program to support NASA's science and engineering missions
  - Prototypes advanced networking capabilities in collaboration with Stakeholders
  - Supports an innovative network technology testbed between Ames, Goddard and Marshall to address current and future network gaps and challenges
  - Maintains NASA's dedicated advanced peering capability
  - Assures Civil Servant high-end networking technical expertise
  - Leverages collaboration with multiple government agencies, industry and university partners to conduct technology investigations in a cost effective manner

# NCCS Stakeholder Input to ENT T Formulation

## **Forces driving NCCS's networking requirements**

Plans to enable increased collaboration by GSFC scientists with research partners, including internationals, via productivity enhancing software tools such as the Earth System Grid (ESG)

Paradigm shift in sources of data desired by GSFC scientists from NASA-provided to globally-provided (NASA | global ratio going from 80 | 20  $\rightarrow$  20 | 80)

Explosion in data set size due to higher resolution models accommodating larger numbers of data types

## **Nearterm NCCS networking needs**

Significantly enhanced data throughput from NCCS's computational engine (Discover) to NCCS's Internet server (Data Portal)

Support for live access visualization service for remote scientists

Enhanced local analytics involving multiple data sets for ESG users and others

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

91

# NCCS Stakeholder Input to ENT T Formulation

## Derived Network Technology Investigations (prioritized)

1. Performance measurement tools
2. Network technologies enabling 40G & 100G data flows
  - a) Testbed workstations/clusters with enhanced file transfer capabilities; NCCS' production capabilities will also be used for baselining
  - b) Local area Ethernet switches, border routers & Firewalls
  - c) Metro and wide area DWDM transport, optical switching & "test" networks that have SLAs very different from those of NASA's production networks
3. QoS approaches, e.g.:
  - a) Distributed caching
  - b) Application-to-network signaling
4. Alternate network & transport layer protocols, e.g., IPv6, UDT & UTX
5. More effective collaboration tools involving HiDef video conferencing, whiteboards, etc

# Climate Community need for Data Services

Source: Harper Pryor (NCCS/SAIC)

- Climate Scientists need access to a broad range of observational data and model output that resides in research institutions throughout the world. These data collections add up to many petabytes of data.
  - Doing Climate Science:
    - Studying fundamental processes at work in the Earth's climate system
    - Quantifying the forcings – the factors that affect the Earth's energy balance and drive climate change
    - Studying the climate record
  - Doing Climate Modeling:
    - Validating the algorithms used to represent physical processes
    - Validating climate models by testing them against available climate data
    - Initializing models

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

93

# Roadmap of Evolving Capabilities

Source: Harper Pryor (NCCS/SAIC)

- **Data Portal** – project specific collaborative data sharing services
  - MAP projects with web distribution of data products & visualization data sets
  - NASA Field Campaign with support for flight planning
  - OSSE nature runs and climate data to the international OSSE science teams
  - Cloud Library to distribute GSFC science results from cloud resolving models
- **ESG Data Node** – broad climate community access to model projections
  - IPCC contributions generated by GMAO and GISS
  - Non-IPCC model output to scientific community
  - Provide analytic capabilities unique to the climate data users
- **GES DISC Access** – supporting access to observing system data
  - GES DISC Tools (Giovanni, Mirador, S4P) - data identification, manipulation, and visualization
- **iRODS** – data management layer to provide access to global data sets
  - Access to remote data sets, simulations, and observations without copying data
  - Join federated iRODS community to more easily access and distribute data

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

# Earth System Grid

Source: Harper Pryor (NCCS/SAIC)

- Unified infrastructure environment to catalog and widely publish petabytes of distributed climate data so as to make it easily accessible to an international community of potential users – data remain resident within HPC environment where created.
- Approach:
  - Data node software developed and distributed by PCMDI
  - Adopts standard formats and protocols in use throughout climate community
  - NCCS implementing ESG Data Node into NCCS Data Portal
  - NCCS integrating Live Access Server (LAS); collaborating with LANL to incorporate capabilities for climate data analysis and visualization
- Capabilities:
  - Secure access
  - Monitor system and service usage
  - Catalog with metadata search capability
  - Transport, aggregation and subsetting
  - Distribute

04/16/10

GODDARD SPACE FLIGHT CENTER

J. P. Gary

95

## **ESG-CET Project**

### **Major Data Access/Transfer Tools**

- ESG Gateway/Data Portal (web)
- GridFTP & Reliable File Transfer (RFT) Service
- Live Access Server (LAS)
- Open-source Project for a Network Data Access Protocol (OPeNDAP)
- DataMover (Bulk Data Movement)/Storage Resource Broker
- Data Nodes typically with "in place" analysis capabilities

# Data Management Requirements for Climate

Source: Dan Duffy (GSFC/NCCS)

- Easier and high performing mechanism for storing data (long term) when computing in a geographically distributed environment
  - NASA Goddard, NASA Ames, Oak Ridge, and others
- Store and query metadata
- Federate observational and model data sources
- Provide mechanisms to transfer and translate data from its source in one format to its destination in the desired format
- Where did we start?
  - Underlying file transfer mechanisms
  - Open source frameworks for data management
  - User requirements

04/16/10

GODDARD SPACE FLIGHT CENTER

97

# Objectives for the Wide Area Data Transfer Test Bed

Source: Dan Duffy (GSFC/NCCS)

- Testing of potential wide area data transfer mechanisms as the basis for data management infrastructure and/or framework
- Compare traditional versus new file-copying utilities and mechanisms
- Determining optimal tuning parameter settings across wide area networks over multi-10 Gbps links
- As a baseline, determine maximum memory-to-memory throughput performance among the workstations and servers using nuttcp (<http://www.nuttcp.org/>)
- Basis for building the GSFC/High End Computing 20, 40 and 100 Gbps network testbed

## NCCS Stakeholder Input to ENTT Formulation

### **Future NCCS Network Technology Needs: Frameworks**

- The network technology needs include:
  - Not only wide area network infrastructures within NASA and with NASA external partners
  - But also local area network components such as user-managed firewalls, switches and routers
  - And even network aspect of facility-based and/or end-user computers and software application mods to enable more effective data transfers to enhance science research
- The network technology needs change with time, such as indicated in the following draft timeline of NCCS' 4x10G, 1x40G & 1x100G testbedding interests

## NCCS Stakeholder Input to ENTT Formulation

### **Future NCCS Network Technology Needs: Derived**

- Testbed\* workstations/clusters with 40G & 100G data flow capabilities
  - NICs: initially via 4x10G link aggregation, but native asap
  - Motherboards with multiple PCIe G2 & G3 interfaces
  - Four and more cores per processor: Nehalem architecture or better
  - Very fast but inexpensive disks: likely SSD based
  - Various data transfer applications for benchmarking and, where possible, tuning
- \*NCCS' production capabilities will also be used for baselining
- Local area network components
  - Ethernet switches and border routers; multiple 10G, 40G & 100G interfaces
  - Firewalls: multiple 10G, 40G & 100G interfaces
- Metro and/or wide area network components
  - DWDM optical transport and switching
  - Note: a significant amount of end-to-end data flow testing can and should be done over “test” networks that have SLAs very different from those of NASA's production networks
